

Low-fidelity prototype of shopping cart page:

- For the low fidelity prototype, I focused on the overall structure of the page and the key elements that needed to be present. I experimented with a few different layouts, including one-column vs two column layouts, and decided to go with a two column layout.
- The left side contains a list of items added to cart, with their name, image, glazing type, quantity, and total price. The quantity and glazing are modifiable, and the item can be removed with a button. The right side is a summary of the total cost breakdown and the checkout button.
